AKS API is a simulator of an analogue signal based on a digital component. It is planned to be developed for devices on the processor, which operate according to the AGC (Automatic Gain Control), AIDC (Automatic Level Control) and AIMC (Automatic In-phase/Quadrature Mixing Control) algorithms for automatic gain control, automatic level control and automatic channel imbalance correction. This device allows to develop your own solutions for automatic gain control, automatic level control, automatic channel imbalance correction, or to perform experiments for these algorithms. This element defines the analogue format of audio signal: A-Format / B-Format. This application will help you to define A-Format format signal: line, track, frequency, tone, time, volume, side tone and others. Anyone who has gone through sound production process, knows that with the passage of time (or changing room conditions) the problem often occurs that the results of mixing are not the same as they were initially. This can cause the loss of quality of the music. One way to solve this is to recalculate (or increase) the tracks' level, and improve the sound. In this case, one is waiting for the right moment.
